Silver: An Element of Good Health

If you’re a silver lover, here’s something else you’ll appreciate about this lustrous metal: it can kill or suppress the growth of microorganisms such as bacteria, mold, and fungus. Silver ions have a toxic effect on these organisms without harm to humans. Its germicidal properties have been well documented through its use in wound dressings to stop infection and promote healing. These properties have the same effect in silver objects. Stainless steel doesn’t offer these benefits nor does it retain its value. Why not buy something that has been staving off illnesses naturally for centuries? Consider drinking from a silver goblet or eating from flatware an elegant way to stay healthier. And when it's time to pass down your silver to the next generation, you can extol silver's health benefits as well.
